Decoration Methods

Rotary Digital Printing.

Now Available

* Selected Products Only

Modern printing methods such as laser and ink-jet printing are known as digital printing. In digital printing, an image is sent directly to the printer using digital files such as PDFs and those from graphics software such as Illustrator and InDesign. This eliminates the need for a printing plate, which is used in offset printing, which can save money and time.

Without the need to create a plate, digital printing has brought about fast turnaround times and printing on demand. Instead of having to print large, pre-determined runs, requests can be made for as little as one print. While offset printing still often results in slightly better quality prints, digital methods are being worked on at a fast rate to improve quality and lower costs.

Fast Turnaround

Rotary Digital Printing.

This printing process is built for impact, giving brands the freedom to go beyond standard decoration. Multi-colour artwork can be produced in one setup, keeping colours bold, consistent, and cost-effective.

Designs aren't limited to a single panel – they can flow seamlessly around the entire surface of an item, creating a striking wraparound effect that grabs attention from every angle. To top it off, you can select either a matte or glossy finish, tailoring the final look to perfectly match your brand's personality.

Designs

Matte or Glossy finishes
to suit your brand

Laser engraving is the practice of using lasers to engrave or mark an object. The technique does not involve tool bits which contact the engraving surface and wear out. This is considered an advantage over alternative engraving technologies where bit heads have to be replaced regularly.

Variable data printing lets you personalise each item with unique details like names, messages, or company information – all without slowing down the print process. It's a clever way to make every piece feel one-of-a-kind, perfect for campaigns or gifts that call for a personal touch.

Permanent, High
Precision Marking

Works across
multiple materials

Pad printing is a printing process that can transfer a 2-D image onto a 3-D object. This is accomplished using an indirect offset printing process that involves an image being transferred from the printing via a silicone pad onto a substrate.

Pad printing is used for printing on otherwise impossible products in many industries including medical, automotive, promotional, apparel, electronics, appliances, sports equipment and toys.

Prints on complex
3D surfaces

High detail,
multi-colour capable

Screen Printing.

Screen printing is a printing technique that uses a woven mesh to support an ink-blocking stencil. The attached stencil forms open areas of mesh that transfer ink or other printable materials which can be pressed through the mesh as a sharp-edged image onto a substrate.

A squeegee is moved across the screen stencil, forcing or pumping ink through the threads of the woven mesh in the open areas.

vibrant colours

Digital Labels are exactly what they sound like—stickers that mean business. Printed with the digital CMYK process onto rolls of adhesive-backed vinyl, they bring vibrant, full-colour designs to life in just one setup.

These labels can be applied across a wide range of products, making them a go-to option for quick branding, eye-catching packaging, or promotional flair. With the ability to handle multi-colour printing seamlessly, Digital Labels deliver flexibility, speed, and standout results without the fuss.

Multi Colour Printing
in One Pass

Sublimation printing uses heat to bond your design directly into the product, creating rich colours that stay vibrant wash after wash.

The process involves printing sublimation dyes in reverse onto specialised transfer paper before heat-pressing them into polyester fabric. Because the material itself absorbs the ink, the result is a smooth finish that won't fade, crack, or peel, making it a standout choice for long-lasting branding.
